

Boat & Canoe Ramps

Flexamat concrete blocks are a 5,000 psi concrete block with an embedded high strength geogrid. The spacing between the blocks allows for vegetation to stabilize and strengthen the system.

Flexamat is packaged in rolls and is available in widths up to 16' x 50'. Multiple smaller rolls can be abutted together.

Allows a quick access for dredging equipment, fishing boats and canoe access.

Efficient Installation:

- Grade the surface smooth, unroll the Flexamat, soil fill the blocks with 2" of fill, and seed.
- Anchor trenches filled with stone are recommended on larger lakes and rivers.

Manufacturer will assist with initial installation. Installation CAD details and video are available.
